DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 8/21/06 has been entered.

Allowable Subject Matter

2. Claims 11-17, are allowed.

The following is an examiner's statement of reasons for allowance:

Regarding claim 11, 13, 14, 16, the present application teaches a method/radio terminal apparatus in a CDMA mobile communication system that receives a first signaling signal (SS1) and generates and transmits a second signaling (SS2). When the radio terminal apparatus detects the reception of SS1, it transmits SS2 along with user data at varying transmission power. When the radio terminal apparatus detects that SS1 is no long being received, it discontinues transmitting SS2 is no longer being received, it discontinues transmitting SS2 is no longer being received, it discontinues transmitting SS2 and transmits user data at a fixed transmission power as specifically mentioned on claims 11, 13, 14, 16.

Application/Control Number: 10/612,289

Art Unit: 2617

The closest prior art such as Henry (US Patent 6,832,075) discloses a radio that receives user data and a signaling signal and transmits user data and a signaling signal. A loopback module includes a plurality of signal paths and is designed to mix an incoming phone signal with a signal from a signal generator to produce a loopback signal at the receive frequency of the phone. The loopback signal is applied to the phone's antenna. The phone then evaluates the loopback signal to determine the appropriate offset for the transmitter chain at that frequency and power level. This process is iterated until the desired number of frequencies and power levels are tested for proper calibration. The offsets are stored in memory for later use by the phone. However, Henry does not disclose any dependency between the received and transmitted signaling signals, and more specifically does not disclose transmitting a signaling signal generated by the radio only while receiving a signaling signal generated by the radio signal from another device, further Henry does not disclose suspending the transmission of the signaling signal when reception of a signaling signal is no longer detected as specifically mentioned on claims 11, 13, 14, 16.

Conclusion

3. Any responses to this action should be mailed to:
